# The Job Shop Scheduling Problem Solved with the Travel Salesman Problem and Genetic Algorithms 

 INFORMS Annual Meeting 2013 Eva Selene Hernández Gress Autonomous University of Hidalgo
## Abstract

In this paper we proposed a solution to the JobShop Scheduling Problem using the Traveling Salesman Problem solved by Genetic Algorithms. Different tests are performed to solve the Traveling Salesman Problem with the two types of selection (tournament and roulette) under different parameters: number of individuals, number of iterations, crossover probability and mutation probability. Then the best type of selection and the best parameters are used to solve the Job-Shop Scheduling Problem through the Traveling Salesman Problem. Different cases in the literature are solved to compare results.

## Agenda

- Introduction
- The Travel Salesman Problem solved with Genetic Algorithms
- The Job Shop Scheduling solved as a Travel Salesman Problem
- Conclusions

## Introduction

- This research modeled the Traveling Salesman Problem (TSP) through integer programming to analyze the number of cities that was feasible to solved by this method.
- Then we proposed a Genetic Algorithm which was tested with some examples where the solution was found through integer programming.

## Introduction

- Also we used Genetic Algorithms to solve some examples where the solution could not be found by integer programming because the number of constraints grows exponentially as the number of cities visited.

The TSP solved by genetic algorithms (GA) was used to solve the Job Shop Problem (JSP).

## Introduction

The conventional methods such as integer programming report a border in time to determine the optimal sequence in the JSP in a reasonable computational time (Tamilarasi and Anantha, 2010).

- Through the resolution of TSP with GA a method for solving it is validated.

## The Travel Salesman Problem

The TSP is a combinatorial optimization problem in which a salesman visits only once each of the cities and back to the starting point, the problem consist in locate the path with the shortest distance and it is known as the optimal route.

## The Travel Salesman Problem

The Traveling Salesman has been studied extensively especially with metaheuristics, see for example, the work of Dorigo (1997) with the ant colony method, Cerny (1985) with the Monte Carlo method; Jog et al. (1991) Chatterjee et al. (1996), Larrañaga et al. (2000), Moon et al. (2002), Fogel (2004) etcwith Genetic Algorithms with very good results. William Cook, Vasek Chvátal and Applegate (Applegate, 2006) have solved the problem for 24, 978 cities in 2004.

## The Travel Salesman Problem

The Traveling Salesman Problem consists in choosing the route that minimizes the distance between cities 1, 2, 3,. . ., N. For $i \neq$ $j, C_{i j}$ is the distance from city $i$ to city $j$ and $C_{i i}=M$, where $M$ is a very large number (relative to the actual distances of the problem).

## The Travel Salesman Problem

The following explains how the experiment was performed with the distance matrix proposed by Winston (2005), shown below:

|  | City 1 | City 2 | City 3 | City 4 | City 5 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| City 1 | M | 132 | 217 | 164 | 58 |
| City 2 | 132 | M | 290 | 201 | 79 |
| City 3 | 217 | 290 | M | 113 | 303 |
| City 4 | 164 | 201 | 113 | M | 196 |
| City 5 | 58 | 79 | 303 | 196 | M |

Table 1. Distance matrix (Winston,2005).

## The Travel Salesman Problem

Table 2. Solution with integer programming

Figure 1. Optimal Route for the Winston (2005) Problem .

## The Travel Salesman Problem

To begin is required to have a square matrix that represents the cost of the distance to travel from the city $i$ to $j$; generating an initial population of a certain number of individuals with random routes, for example, in Table 3 are 10 individuals with five alleles (each allele is a city) and their respective fitness (fitness).

| Individual | Route | Cost | Fitness |
| :---: | :---: | :---: | :---: |
| 1 | $1-2-3-4-5$ | $132+290+113+196+58$ | 789 |
| 2 | $5-3-1-2-4$ | $303+217+132+201+196$ | 1049 |
| 3 | $3-4-5-2-1$ | $113+196+79+132+217$ | 737 |
| 4 | $2-4-5-1-3$ | $201+196+58+217+290$ | 962 |
| 5 | $3-1-4-2-5$ | $217+164+201+79+303$ | 964 |
| 6 | $5-2-3-1-4$ | $79+210+217+164+196$ | 946 |
| 7 | $2-1-5-3-4$ | $132+58+303+113+201$ | 807 |
| 8 | $3-2-1-5-4$ | $290+132+58+196+113$ | 789 |
| 9 | $1-2-5-4-3$ | $132+79+196+113+217$ | 737 |
| 10 | $5-4-1-3-2$ | $196+164+217+290+79$ | 946 |

Table 3. Random routes

## The Travel Salesman Problem

To perform the tournament selection two random permutations of equal size to the number of individuals are generated, for example, $\mathrm{Pl}=6-3-7-8-5-1-2-4-9-10$ first permutation, the second permutation $\mathrm{P} 2=2-4-9-10-6-3-7-8-5-1,6$ and 2 compete and the best (less fitness) is selected. The result can be seen in Table 4.

| Competitors | Winner | Route | Fitness |
| :---: | :---: | :---: | :---: |
| 6,2 | 6 | $5-2-3-1-4$ | 946 |
| 3,4 | 3 | $3-4-5-2-1$ | 737 |
| 7,9 | 9 | $1-2-5-4-3$ | 737 |
| 8,10 | 8 | $3-2-1-5-4$ | 789 |
| 5,6 | 6 | $5-2-3-1-4$ | 946 |
| 1,3 | 3 | $3-4-5-2-1$ | 737 |
| 2,7 | 7 | $2-1-5-3-4$ | 807 |
| 4,8 | 8 | $3-2-1-5-4$ | 789 |
| 9,5 | 9 | $1-2-5-4-3$ | 737 |
| 10,1 | 1 | $1-2-3-4-5$ | 789 |

## The Travel Salesman Problem

After ordering the table is performed the crossover. For crossover an arrangement is randomly generated, the rows are the number of individuals between two, the columns are always two. In the example are $5 \times 2$ with permutations in each column. Column 1 are the Possible Father 1 and column 2 the Possible Father 2. A crossover probability is generated, for example, 0.6 and a random number for each couple also, if it is less than the crossover probability then, the couple formed by the first line of the column Possible Father 1 and the first element the second column of the Possible Father 2 are selected for the crossover.

| Father 1= | 5 | 2 | 3 | 1 | 4 |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Father 2= | 1 | 2 | 5 | 4 | 3 |
|  |  |  |  |  |  |
| Child 1= | 5 | 2 | 5 | 4 | 4 |
| Child 2= | 1 | 2 | 3 | 1 | 3 |

## The Travel Salesman Problem

The last operator is the mutation, this is done by selecting a probability of mutation, in this case 0.1 , and generating a random number for each individual. After generating a random number the only one that turned out to be less than 0.1 was individual 2. For this particular individual, two points are selected for example 2 and 5 position are exchanged.

| Individual 2= | 4 | 2 | 1 | 5 | 3 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Mutation $=$ | 4 | 3 | 1 | 5 | 2 |

## The Travel Salesman Problem

| Experiment (Number of Cities) | Selection | Individual | Generation | Crossover probability | Mutation Probability | Time (seconds) | Experiment Result | Best result in literature |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { (Winston,2005): } \\ & 5 \end{aligned}$ | Tournament | 100 | 100 | 0.6 | 0.1 | 2 | 668 | 668 |
| 5 | Roulette | 100 | 100 | 0.6 | 0.1 | 2 | 668 | 668 |
| (Gerhard,2006): $10$ | Tournament | 100 | 100 | 0.6 | 1/10 | 3 | 1185 | 1185 |
| 10 | Roulette | 100 | 100 | 0.6 | 1/10 | 3 | 1185 | 1185 |
| 10 | Tournament | 100 | 100 | 0.6 | 0.1 | 3 | 7392 | 8914 |
| 10 | Roulette | 100 | 100 | 0.6 | 0.1 | 3 | 7392 | 8914 |
| 15 | Tournament | 100 | 100 | 0.6 | 0.05 | 5 | 1692 | 1513 |
| 15 | Roulette | 100 | 100 | 0.6 | 0.05 | 5 | 1757 | 1513 |
| 20 | Tournament | 100 | 100 | 0.6 | 1/20 | 7 | 1700 | 1688 |
| 20 | Roulette | 100 | 100 | 0.6 | 1/20 | 7 | 1854 | 1688 |
| 21 | Tournament | 100 | 100 | 0.6 | 0.05 | 8 | 2042 | 2042 |
| 21 | Roulette | 100 | 100 | 0.6 | 0.05 | 8 | 2077 | 2042 |
| 280 Cities (Gerhard, 2006) |  |  |  |  |  |  |  |  |
| AO | Tournament | 100 | 20000 | 0.6 | 0.1 | 420 | 6213.25 | 2579 |
| BT | Roulette | 100 | 20000 | 0.6 | 0.1 | 900 | 7968.55 | 2579 |
| AP | Tournament | 500 | 20000 | 0.6 | 0.1 | 2220 | 6750.22 | 2579 |
| BU | Roulette | 1000 | 20000 | 0.6 | 0.1 | 13680 | 8686.33 | 2579 |
| AQ | Tournament | 1000 | 20000 | 0.6 | 0.1 | 4200 | 5656.54 | 2579 |
| CA | Roulette | 1000 | 20000 | 0.6 | 0.1 | 13980 | 8686.33 | 2579 |
| AR | Tournament | 2000 | 20000 | 0.6 | 0.1 | 8400 | 6424.03 | 2579 |
| BX | Roulette | 2000 | 20000 | 0.6 | 0.1 | 28860 | 10820.19 | 2579 |
| AS | Tournament | 5000 | 20000 | 0.6 | 1/280 | 46810 | 5325.67 | 2579 |
| BI | Roulette | 5000 | 20000 | 0.6 | 1/280 | 76680 | 7433.69 | 2579 |
| BZ | Tournament | 20000 | 1000 | 0.6 | 1/280 | 3600 | 7205.13 | 2579 |
| AT | Roulette | 20000 | 1000 | 0.6 | 1/280 | 21600 | 5509.59 | 2579 |
| BJ | Tournament | 50000 | 1000 | 0.6 | 1/280 | 81140 | 4724.52 | 2579 |

From these examples it can be concluded that the tournament selection is the best, it is necessary to consider a relatively large number of individuals in the population with a moderate number of iterations (at a ratio of 10 individuals for one iteration approximately) as we can observe in examples BZ, AT and AJ. The skossover probability works best is the 0.6 and low mutation probability ( $1 / n$ ), wheremis the number of individuals

## The Job Shop Problem

- Among the authors who have used metaheuristics for their solution stand Yamada and Nakano (1998) and Sivanandam and Deepa (2008) with genetic algorithms, Bozejko et al. (2009) with simulated annealing, Huang (2004) and Ge et al. (2007) hybrid algorithms ( genetic algorithms and optimization particles) and Anantha \& Tamilarasi (2010) with a hybrid genetic algorithm and simulated annealing, etc.

## The Job Shop Problem

The Job Shop Problem is to schedule a set of jobs in a set of machines, subject to the constraint that each machine can handle one job in a time. The objective is to schedule the jobs so as to minimize the maximum of their completition times.

## The Job Shop Problem

- This is an exampled presented in Anantha y Tamilarasi (2010):

| $\mathrm{O}_{1}=\mathrm{J}_{1} \mathrm{M}_{1}=2$ | $\mathrm{O}_{2}=\mathrm{J}_{1} \mathrm{M}_{3}=3$ | $\mathrm{O}_{3}=\mathrm{J}_{1} \mathrm{M}_{2}=4$ |
| :---: | :--- | :--- |
| $\mathrm{O}_{4}=\mathrm{J}_{2} \mathrm{M}_{2}=1$ | $\mathrm{O}_{5}=\mathrm{J}_{2} \mathrm{M}_{1}=5$ | $\mathrm{O}_{6}=\mathrm{J}_{2} \mathrm{M}_{3}=2$ |
| $\mathrm{O}_{7}=\mathrm{J}_{3} \mathrm{M}_{3}=4$ | $\mathrm{O}_{8}=\mathrm{J}_{3} \mathrm{M}_{1}=6$ | $\mathrm{O}_{9}=\mathrm{J}_{3} \mathrm{M}_{2}=4$ |

Table 8. JSP with 3 jobs and 3 Machines [4].
The optimal result is 17 units of makespan with their method.

## The Job Shop Problem

- To solve the JSP like a TSP, each operation of the JSP is consider as a city of the of the TSP.

| Time |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 2 | 3 | 4 | 5 |
| $\mathrm{O}_{1}=\mathrm{J}_{1} \mathrm{M}_{1}$ |  |  |  |  |
|  | $\mathrm{O}_{2}=\mathrm{J}_{1} \mathrm{M}_{3}$ |  |  |  |

| Time |  |  |  |  |  |  |
| :---: | ---: | ---: | :--- | ---: | ---: | :---: |
| 1 | 2 |  | 3 |  |  |  |
| $\mathrm{O}_{1}=J_{1} \mathrm{M}_{1}$ |  |  |  |  |  |  |
| $\mathrm{O}_{6}=\mathrm{J}_{2} \mathrm{M}_{3}$ |  |  |  |  |  |  |

Figure 6: JSP as a TSP

## The Job Shop Problem

The distance matrix the TSP is:

|  | $\boldsymbol{O}_{\mathbf{1}}$ | $\boldsymbol{O}_{2}$ | $\boldsymbol{O}_{3}$ | $\boldsymbol{O}_{4}$ | $\boldsymbol{O}_{5}$ | $\boldsymbol{O}_{6}$ | $\boldsymbol{O}_{7}$ | $\boldsymbol{O}_{8}$ | $\boldsymbol{O}_{9}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\boldsymbol{O}_{\boldsymbol{1}}$ | M | 5 | 6 | 2 | 7 | 2 | 4 | 8 | 4 |
| $\boldsymbol{O}_{2}$ | 5 | M | 7 | 3 | 5 | 5 | 7 | 6 | 4 |
| $\boldsymbol{O}_{3}$ | 6 | 7 | M | 5 | 5 | 4 | 4 | 6 | 8 |
| $\boldsymbol{O}_{4}$ | 2 | 3 | 5 | M | 6 | 3 | 4 | 6 | 5 |
| $\boldsymbol{O}_{5}$ | 7 | 5 | 5 | 6 | M | 7 | 5 | 11 | 5 |
| $\boldsymbol{O}_{6}$ | 2 | 5 | 4 | 3 | 7 | M | 6 | 6 | 4 |
| $\boldsymbol{O}_{7}$ | 4 | 7 | 4 | 4 | 5 | 6 | M | 10 | 8 |
| $\boldsymbol{O}_{8}$ | 8 | 6 | 6 | 6 | 11 | 6 | 10 | M | 10 |
| $\boldsymbol{O}_{9}$ | 4 | 4 | 8 | 5 | 5 | 4 | 8 | 10 | M |

Table 9. Distance matrix

## The Job Shop Problem

- Solving the problem with GA in Matlab the same result is obtained, the route of operations for the TSP is:

Figure 7. Route for the JSP of Tamilarasi y Anantha (2010).

## The Job Shop Problem

- The route can be converted as a JSP:

Figure 8. Makespan for the JSSP of Tamilarasi y Anantha (2010)

## The Job Shop Problem

- A comparative table is presented with the results of the problems founded in Tamilarasi y Anantha (2010) y Ruiz (2010) and all of them belong to JSP bechmark problems of Beasley (1990).

| Experiment | Individual | Generation | Crossover <br> probability | Mutation <br> Probability | Time <br> (seconds) | Result <br> obtained in <br> the <br> experiment | Best <br> result <br> (Ruiz, <br> 2011) |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Tamilarasi y <br> Anantha <br> $(2010)$ | 1000 | 100 | 0.6 | $1 / 9$ | 120 | 17 | 17 |
| FT06 (Ruiz, <br> 2011) | 1000 | 100 | 0.6 | $1 / 36$ | 180 | 55 | 55 |
| LA04 (Ruiz, <br> 2011) | 60000 | 300 | 0.6 | $1 / 50$ | 64800 | 621 | 590 |
| FT10 (Ruiz, <br> 2011) | 50000 | 1000 | 0.6 | $1 / 100$ | 41230 | 1156 | 930 |
| LA02 (Ruiz, <br> 2011) | 50000 | 1000 | 0.6 | $1 / 50$ | 40120 | 768 | 655 |
| LA03 (Ruiz, <br> 2011) | 50000 | 1000 | 0.6 | $1 / 50$ | 40100 | 699 | 597 |
| LA12 (Ruiz, <br> 2011) | 70000 | 1250 | 0.6 | $1 / 50$ | 110801 | 1412 | 1039 |
| LA 13 (Ruiz, <br> 2011) | 50000 | 1000 | 0.6 | $1 / 100$ | 75900 | 1520 | 1150 |

Table 10: Comparative results for the JSP .

## Conclusions

The parameters of the GA for solved the TSP that were founded are

- The tournament selection has better performance than the roulette selection.
The number of individuals is greater than the number of iterations in a proportion of 10 individuals for approximately one iteration.
- Crossover probability shows the best results in 0.6
- The probability of mutation used was relatively low $1 / n$, where $n$ represents the number of cities in the problem.

## Conclusions

- Solve the JSP through the TSP is an alternative to address this problem.
- The JSP has been good results solve with metaheuristics.
- In the experiments of JSP, we reach certain results but mostly we just approach the solution found in scientific articles.
